

# Pacific Ocean perch (*Sebastes alutus*) cruises off the northern Washington coast during 1971 and 1972

Management and Research Division, Washington Dept. of Fisheries - 5. Fisheries

Description: -

-

Pacific ocean perch -- North Pacific Ocean -- Statistics.

Pacific ocean perch -- Washington (State) -- Statistics. Pacific Ocean perch (*Sebastes alutus*) cruises off the northern Washington coast during 1971 and 1972

-

Groundfish data report series -- no. 17. Pacific Ocean perch (*Sebastes alutus*) cruises off the northern Washington coast during 1971 and 1972

Notes: Cover title.

## Influence of improved performance monitoring on the consistency of a bottom trawl survey

This number is likely an underestimate, based on the rate of discovery of undescribed species. Gravimetric subsampling has been reported to have lower variance than volumetric subsampling for some species McGregor 1922, Wolfert 1969, Bagenal 1978 and I examined this for *S.* It is the smaller net used to catch macroplankton.

## A review of the genus *Helicometra* Odhner, 1902 (Digenea: Opecoelidae: Plagioporinae) with a key to species including *Helicometra overstreeti* n. sp. from the cusk

The difference in these maxima is consistent with the available habitat in each locality, the Rennell Sound stock inhabiting a narrow offshore bank while the Vancouver Island stock occupies a broad coastal slope. Opresko has revised the antipatharians in a series of papers.

## Darkblotched rockfish (*Sebastes crameri*) COSEWIC assessment and status report 2009

The crustaceans have been fairly well documented. Pack ice provided a platform for sampling from stations such as T-3 and Arctic Ice Dynamics Joint Experiment in the 1960s and 1970s, and extensive Arctic nearshore research was funded by MMS through OCSEAP in the 1970s and 1980s.

## Habitat

The major source of differences was a geo-graphic line, increasing north to south. It also is characterized by a relatively undivided continental shelf, considerable runoff, especially from the Columbia River, and extremely complex flow patterns within the California Current system, including upwelling.

## Ecology of pelagic larvae and juveniles of the genus *Sebastes*

Mean length at age distribution for Vancouver Island *S.*

## **Comparative survivorship and life history of painted greenling ( *Oxylebius pictus* ) in Puget Sound, Washington and Monterey Bay, California**

I used the mean of the five first eigenvectors to quantify the effect of arching on each x- and y-coordinate. « We believe that an asymptotic function is appropriate to describe the growth of individual fish Brett and Groves 1979 but we also believe that smaller sizes of older fish are representative observations. In Chapter 4, I present two mass-balance trophic models of one of B.
