Computational Modelling Of High Impact Loading Biology Essay

The impact causes a large shear stress in the material and material undergoes crushing. In addition, the stronger material offered a better penetration capability even at normal velocities. The dominant fracture mechanism depends mainly on the caliber thickness.

Dynamic Response and Microstructure Evolution of Oxygen

Journal of Materials Processing Technology 96, 1—3, pp. These features are characteristic of a single, violent contact with a hard organic material. It is recognised Zukas 1990 that the release adiabat is not very well known for brittle materials such as concrete.

Hydrocode and microstructural analysis of explosively formed penetrators, Journal of Materials Science

Principal stress includes volumetric as well as deviatoric stress components, and the model takes into account damage resulting from both these components. In a situation where the projectile does not penetrate the armour, it shatters against the surface or bounces away. For each experiment, the distal part of the two edges as well as the convergent extremity were involved.

Mechanisms of Armour Penetration

Three deer and a lamb carcass, the leg and axial skeleton spinal column, sternum, ribs of a bison, two cow femurs and the spinal column of a horse were fractured. The natural state of iron at room temperature. Based on chapters 2 and 2.
