**Algoa Group — Wikipedia  
Republished // WIKI 2**

Die Schelm Hoek Formasie wat tans nog afgeset word, het ontstaan uit die transgressiewe maksimum van die Flandriese transgressie aan die begin van die Holoseen. Its unconsolidated nature distinguishes this unit from underlying calcareous sandstones of the Nahoon, Salnova and Nanaga. However, the remains of marine and terrestrial mammals, stone and bone artifacts, and occasional pottery pieces are also found.
