Geologic Map of the Madison Junction Quadrangle, Yellowstone National Park, Wyoming. (1974 edition)

It is important not to think of geothermal waters as typically flowing through underground caves except in unusual circumstances.

NGMDB Product Description Page

At a minimum, field personnel should measure thermal water discharge at high-flow and low-flow conditions.

Geolex — CentralPlateau publications

The cost of a real-time gauging station depends upon the type of pressure sensor, data, and transmission equipment, and on personnel costs associated with the physical measurements and maintenance of the gauge.

Most vendors sell a variety of probes with different lengths, sheathing, and versatility. One research effort by the University of Utah involved a temporary deployment of several survey-grade GPS instruments and temporary seismometers in Norris to determine ground deformation within the hydrothermal basin.

There are many sources of information that should be searched. This recommendation is important whether field personnel are taking measurements in easily accessible hydrothermal areas or difficult-to-access hydrothermal areas.

Government Printing Office, 1976 Length 35 pages Export Citation. Nicholson 1993 describes many of these ratios and includes appropriate formulas.

In systems where CO₂ is a concern, gas sampling should be done under a variety of weather conditions to establish typical background concentrations. Download the latest version of , free of charge. Highly trained personnel also must ensure that image acquisition, geometric corrections, and processed imagery meets the goals of the thermal-infrared survey of active hydrothermal systems.

Monitoring Geothermal Systems and Hydrothermal Features (U.S. National Park Service)

Instruments can detect or sense reflected visible energy less than 1 micron wavelength or radiated thermal-infrared energy ³. Most manufacturers of temperature data loggers will conduct calibrations for an additional fee. Note the temperature variation in the pool's outflow from 45 °C to 70 °C.
