Rescue the retina after the ischemic injury by polymer

PBEMA polymers are particularly noteworthy because of their H₂O₂-dependent release of quinone methide, which in turn depletes intracellular glutathione levels, suppressing the antioxidative capability of cancer cells. Chemical cross-linking methods for cell encapsulation in hydrogels. The dual-stimuli responsive approach is ideally suited for theragnostic a combination of diagnostics and therapy because some functionalities can provide on-site feedback and diagnostics, while others could initiate curing and therapy.

Alumni

It demonstrates the obligatory need for applying an understanding of the cross talk between physicochem. The researchers further optimized the formulation to be non-toxic against human fibroblasts while still maintaining good antimicrobial activity. Inspired by the biopolymer brush, we synthesize a polymer network by crosslinking bottlebrush rather than linear polymers.

Synthesis of UV crosslinkable waterborne siloxane

Nayak, Gauri Shankar Shaw, K.

Alumni

For SEM characterization, the hydrogel was swelled with deionized water and lyophilized in a freeze dryer SCIENTZ-10N. A combination of GOx with materials that alter their properties due to changes in products of the GOx cycle i. The black arrows mean infiltration of inflammatory cells.
