simulating subsurface flow: Topics by Science.gov

The construction type of canisters introduced here is a solid structure with a cast insert and a corrosion resistant overpack.

Green building

Clogging of granular hoppers account for significant losses across many industries. Government work and is in the public domain in the USA. Results indicate that laterally discontinuous till units forming localized hydraulic barriers substantially affect flow patterns and contaminant transport in the shallow subsurface at Sellafield.

deep ocean disposal: Topics by Science.gov

The paper highlights some of the challenges facing a deep geological disposal program in the UK to review understanding of the natural changes that may affect siting and design of a GDF. A long-coring campaign on Bermuda Rise has provided additional abundant high-quality sediments from this site of rapid accumulation in the deep western basin, situated beneath the subtropical gyre of the North Atlantic Ocean. Disposal options for DSG include jettison of a used logistics module containing waste after every human stay, jettison of the same logistics module after several missions once it is full, regular disposal of trash via an airlock, or gasifying waste products for easier disposal or reuse.

Green building

In addition, we quantify the diabatic transformation along particle trajectories, to identify where diabatic processes are important along the upwelling pathways.

simulating subsurface flow: Topics by Science.gov

To achieve the main objective of our research, i. It was appeared that numerical simulation would be favorable for substrate structure optimization in subsurface flow constructed wetlands. Limestone and zeolite have been identified as effective supporting media in subsurface flow wetlands aiming As removal.

deep ocean disposal: Topics by Science.gov

The results confirmed that concentrated subsurface lateral flow occurred at the interfaces with the clay layer and the underlying bedrock. Notable are the scientific contributions to understanding the sea floor.

Green building

The model uses rainfall, elevation data, a hydraulic conductivity, and a storage coefficient to predict the saturated thickness in time and space. A bacterial source of H₂O₂ is the most likely origin and we show that this source is likely sufficient to account for all of the observed H₂O₂ in the deep ocean. The Reporting Framework contains the core product of the Sustainability Reporting Guidelines, as well as Protocols and Sector Supplements.

deep ocean disposal: Topics by Science.gov

The Code is intended as a good practice global standard for measuring the environmental performance of corporate buildings. The cluster results in combination with a hydrologic model are used for discharge separation. These infragravity wave energies are expected to be a significant contribution to the error budget for possible measurements of sea level associated to sub-mesoscale currents at horizontal scales around 10 km.
