An Analysis of Family Estrangement, Causes, and Factors

In the case of mothers with substance abuse, caseworkers may be more likely to perceive that children have experienced severe risk and harm. Many people misuse alcohol, eg. However, many universal interventions have the potential to prevent or mitigate mental illness before it has serious impacts on parenting, and a number of smaller studies have shown positive or promising results of such interventions.

Culture and Substance Abuse: Impact of Culture Affects Approach to Treatment

Anomie, or loss of a healthy ethnic or cultural identity, may occur among native populations whose cultures have been devastated by the extensive and sudden influx of outside influence. In some cases, limited or no contact with abusive parents can be curative.

An Analysis of Family Estrangement, Causes, and Factors

A newer observational study in the United Kingdom using a video feedback intervention found that between the time of admission and discharge, mothers with schizophrenia, severe depression, and mania became more sensitive and less unresponsive, and their infants became more cooperative and less passive. Aggression and antisocial behavior in young children appear to reach a peak between the ages of 2 and 4 and then decline, only to reemerge in the adolescent years.

Adult Learning Theories and Principles

With respect to mental health, a national study of low-income women found that just one-quarter of those with any mental health disorder had sought treatment in the past month. The thing is, when you say nothing, you enable them to continue to hurt themselves. You come to understand your own behavior much better.

How childhood trauma changes our mental health into adulthood

In a randomized controlled trial independent from the developer, Webster-Stratton, identified low-income families with a child ages 2-5 at risk for disruptive behaviors as a result of having a sibling or other relative with ODD or conduct disorder or a criminal history.
