A one-dimension 1-D physical-biological coupled model based on the large multiparametric database of the Malina project in the Beaufort Sea was used i to infer the functioning and nitrogen fluxes within the summer plankton ecosystem and ii to assess the model sensitivity to key light-associated processes involved in nutrient recycling and phytoplankton growth. A strong seasonal cycle is evident in the observed radon concentrations, with maxima during the winter months, when air masses arriving at the Cape Point station from over the African continental surface are more frequently observed, and minima during the summer months, when an oceanic fetch is predominant.

Lower THg concentrations were associated with higher body mass index BMI and higher proportions of lower trophic position food resources consumed. The Long Valley Caldera LVC is an active volcanic system situated along the eastern front of the Sierra Nevada mountain range in east-central California. Copyright © 2017 Elsevier Ltd.

. The correlation of ambient noise with ice drift peaked for locations at ranges of ~300 km off the mouth of the Amundsen Gulf. Unconventional gas extraction often targets geological layers with high naturally occurring radioactive materials NORM and extraction practices may possibly mobilise radionuclides into regional and local drinking water resources.
