Conversely, and both originated in English-speaking countries but are not related to each other; ASL however is related to. On top of handshape variation, my dissertation includes detailed analyses of temporal information of the fingerspelling of native asl signers. Evidence for coordinative structures, groups of individual articulators constrained to act as a single functional unit, is found in a high degree of entrainment during transitions.

From these detailed analyses of articulator timings and velocities, conclusions are drawn which suggest that, like speech, fingerspelling may be explained in terms of coordinative structures and task dynamics. I have made up names for the following that seem to adhere most of the conventions.

In Italian Sign Language, fingerspelled words are relatively slow and clearly produced, whereas fingerspelling in standard BSL is often rapid so that the individual letters become difficult to distinguish, and the word is grasped from the overall hand movement. The results of this research suggest that transitions between targets are important in the fluent production of fingerspelling.
