The American Association for Thoracic Surgery has also published guidelines for the surgical management of pulmonary nodules in lung cancer survivors and other high-risk patients who undergo lung cancer screening with low-dose CT. Median age at diagnosis of the tumors was 45 years, range 4 to 96, female-to-male ratio 1. Although a patient could not be expected to breath-hold through the entire examination, lasting minutes, a separate chest CT can be obtained during a breath-hold to improve the resolution of lung imaging.
