} The SQLite source code contains 1084 uses of the testcase macro. In the upper crust of the Earth, hydrostatic pressure increases at the rate of about 320 bars per kilometre, and temperature increases at a typical rate of 20°–40° C per kilometre, depending on recent crustal geologic history. Compiler bugs, while rare, do happen, which is why it is so important to test the code in an as-delivered configuration.

The main testing process spawns a child process which runs some SQLite operation and randomly crashes somewhere in the middle of a write operation. The numerical results showed that there was negligible variation in the J-integral values calculated for successive contours surrounding the crack tip.

The goal of the laboratory was to provide safety clearance for lunar samples within a period of approximately 30 days. Because it mutates both the input database and the input SQL at the same time, dbsqlfuzz has been able to find some obscure faults in SQLite that were missed by prior fuzzers that mutated only SQL inputs or only the database file. Nevertheless, some warnings might be generated by other static analyzers.
