PIC Microcontrollers: An Introduction to Microelectronics

In addition, more and more electronic packages are being used in very harsh environments. In a simple form it is made of two conductive plates Electrodes and an insulating media Dielectrics which separate the electrodes. Failure of a desktop PC in the office may create inconvenience, but the failure of a pacemaker may be fatal.

In addition to traditional areas of semiconductor processing and packaging of nanoelectronics, emphasis will be placed on areas where multifunctional device integration through innovation in design, materials, and processing at the device and system levels will lead to new applications of nanosystems. The three most common types of packages are TRANSISTOR-OUTLINE TO PACKAGE, FLAT PACK, DUAL INLINE PACKAGE DIP.

PDH Course

Microelectronics is often thought to include only integrated circuits.
