## Government Subsidies and Household Debt Burden After the Great Recession

Using the values for 1983 in Table 3-1, about 20 percent to 35 percent of the 1983-1989 increase in total wealth, and about 50 to 67 percent of the corresponding increase in mean family wealth, was lost during the next three years. We use the above-discussed assumptions to model baseline wealth for married households turning 25 years old in 2020 when they retire 40 years later in 2060. Their share did not increase, rather the reverse — they held 3.

## Fair Lending

The Gini coefficient declined slightly from 1989 to 1992, then increased in each three-year period through 2013. Changes in the Distribution of Wealth, 1983-2013 The distribution of wealth, and also of income, can be measured by describing the entire distribution the Gini coefficient or by measuring the concentration at the high end of the distribution, such as the richest one percent or 10 percent the concentration ratio. For one thing, there were almost 40 million more American families in 2013, almost a 50 percent increase.

## Lexis

The Gini Coefficient The most common quantitative measure of the entire distribution is the Gini coefficient.

## Fair Lending

Their median household income fell by 20 percent between 2007 and 2010, recovering about half of that loss by 2013.
