Sedimentary Petrography Laboratory

Petrographic analyses indicate that the Aldwell Formation has lithologically distinctive eastern and western portions.

Optical Mineralogy and Petrography

The main focus of this work is on the transition from the Lower to Upper Karoo and to the overlying Kalahari Group.

Sedimentary Petrography

These are big files and take awhile to download. The sediments from the Thabala Formation have a geochemical signature typical of wackes, while the sandstones from the overlying Mosolotsane Formation and the Ntane Formation are dominated by arkose to subarkose. When I mark them and return them to you with comments, you will be permitted to resubmit them once for revised assessment.
