Search keys cannot be redundant.

B+ tree

Each internal node and leaf contains 1000 keys. In this case searching or inserting an element will only need to decompress or compress a sub-block instead of a full block.

The marked slots were removed the next time we resized the table. Please note that here, architectural details are described referenced to SQLite 2.

B+ TREE : Search, Insert and Delete Operations Example

The minimum key of the binary tree leaf and its new key address are associated with the top-level node. In most of the other self-balancing search trees like and Red-Black Trees , it is assumed that everything is in main memory.

B+ tree

For the sort of data you're specifying it's a different story. What is a B+ Tree? Therefore split the node from the median i.
