We trained the data within 15% of errors  
of outcome. . Also notable is that ANN  
AOT is underestimated in most IGBP  
types having low slope and negative mean  
bias.

was for training and rest 7 years 2005-2011 for validation of the models. We also statistically analyze factors associated with child P-VCs, by both incident severity and age group, using 3 regression models: negative binomial, probit, and spatial lag models. The study showed that the ANN model could be used as a management tool for predicting runoff and soil loss.

In the formulation of the objective function, we require the lag time which is not known.

Soft computing techniques like Artificial Neural Network ANN , Support Vector Machine SVM and Adaptive Neuro Fuzzy Inference system ANFIS models are constructed using experimental data sets to predict the damage level of non-reshaped berm breakwater. .
