Thermal parameter optimization design of an energy storage system with CO₂ as working fluid

He manages the Net-Zero Energy, High-Performance Buildings Program within the Engineering Lab's Strategic Goal of Sustainable and Energy-Efficient Materials and Buildings. Once the second edition came out I jumped at it and was not disappointed.

Practical examples are used throughout and are drawn from solar energy systems, fuel cell and battery thermal management, electrical and electronics cooling, engine exhaust heat and emissions, and manufacturing processes. Example problems with solutions in each chapter quickly reinforce the concepts discussed.

Design of Thermal Systems

So be warned since right off the bat, the 2nd chapter presents problems in the analysis of systems for optimization, for example a piping system for water conveyance or the design requirement to heat a swimming pool given various constraints. The merit of the book is in its well thought out problems that have been developed from Stoecker's teaching as well as research into real world design problems.
