North American Climate History (1500)

Conclusion A multi-proxy approach, in which tree-ring data were calibrated against instrumental temperature data and in turn used as a calibration target for lower-resolution pollen data, allowed us to develop an annual temperature reconstruction that extends back to 480 CE and spatially covers the majority of temperate North America. The sensitivity of sea ice to Baltic Sea winter temperatures has been investigated by ,.

Characterizing the European Sub

We do not have comparable knowledge concerning the past — only bits and pieces in comparison. All reconstructions are shown as deviations from a 1961 to 1990 average.

North American Climate History (1500)

Greenland's continental glaciers are also retreating due to an accumulation of atmospheric soot and a reduction of fresh snow to cover it. People have short memories indeed! We found that the overall EV amplitude for tri-decadal changes in NAM480 is lower than the amplitude in the other reconstructions ranging between 0.
