Geospatial Standards — Federal Geographic Data Committee

Natural features will be given precedence over constructed features.

3D Elevation Program Standards and Specifications

When this occurs, the markers should be shown close together.

Standard Display

Seamless elevation data are available for the conterminous United States, Hawaii, Alaska, and the U. S. Sufficient values should be positioned near the neatline so that it is possible to determine the value of any contour crossing the neatline. For features other than relief features, the normal rules for use of abbreviations apply.

Standard Display

Scope of this document This document provides the rules and guidelines for the generation of the Geoscience Australia 1:100 000 and 1:250 000 National Topographic Map Series products as well as smaller scale General Reference Map eg 1:2 500 000 products. Conformance to these specifications will assure uniformity through all mapping elements and agencies engaged in the production and maintenance programs for these series. Specifications for type styles, sizes and placement of grid and marginal information are contained in the appropriate format sheets in for both 1:250 000 and 1:100 000 scale.

Standard Display

Geological Survey USGS digital topographic map. When considering the selection of names to be included on the map, every effort should be made to ensure that they are compatible with the particular map area, scale and use. A MapNumber associated with a Kilometric Distance Indicator will not need to be maintained at 1:250 000.

Geospatial Standards — Federal Geographic Data Committee

The following information is applicable to All Scales.
