prevent substance use and abuse.

Sexual assault and sexually transmitted diseases: detection and management in adults and children

In order to prevent SV, we must understand and address at the individual, relational, community, and societal levels.

Sexual Assault and Abuse and STDs

The social significance of an infection that might have been acquired sexually varies by the specific organism, as does the threshold for reporting suspected child sexual abuse. Sexually abused children suffering posttraumatic stress symptoms: initial treatment outcome findings. Confine yourself to the medically relevant history.

What Is Sexual Assault?

In circumstances in which transmission of syphilis, HIV, hepatitis B, or HPV is a concern but baseline tests for syphilis, HIV, and HBV are negative and examinations for genital warts are negative, follow-up serologic testing and an examination approximately 6 weeks and 3 months after the last suspected sexual exposure is recommended to allow time for antibodies to develop and signs of infection to appear.

Sexual assault and sexually transmitted diseases: detection and management in adults and children

Serologic testing for HIV infection should be considered for sexually abused children. Leaders should support this effort by encouraging required members attend the Sexual Assault Case Management Group. Lack of verbal or physical resistance or submission resulting from the use of force, threat of force, or placing another person in fear does not constitute consent.

Sexual assault and sexually transmitted diseases: detection and management in adults and children

In randomized controlled trials RCTs of treatments for non-sexual-assault traumatic events, these interventions have produced greater improvement in functioning and decreased levels of PTSD and depression as compared with supportive counseling SC , and showed differences that persisted through 6-month follow-up. This treatment reduces the risk of pregnancy by 60 to 90 percent.

Reduce the Risk of Becoming a Sexual Assault Victim

The risk of acquiring syphilis from a one-time sexual exposure is estimated to be less than 1 percent. Motile sperm can often be seen up to eight hours postcoitus, and nonmotile sperm may be detected beyond 72 hours.

Reduce the Risk of Becoming a Sexual Assault Victim

Thus, it is not only imperative to document the time frame from time of assault to medical examination , but also to encourage victims to proceed with evidence collection. Lastly, a bimanual and rectal examination should be performed to assess uterine size and to check for masses and tenderness.
