## Multipurpose Trees

Yet much remains to be done, and the development community can and should play a role. But make no mistake, such efforts must be part of the framework of overall economic development to fully succeed. The project contains 10 components, two of which are of primary interest here: natural forest management for sustained yield and the establishment of protected areas.

## MTS

But in the last analysis, will all these things be done? For example, most developing countries with large mature forests have failed to adopt revenue systems that come close to capturing real timber values for the public treasury. The major reason why foresters neglect urban forestry is that most contacts for development assistance in forestry are forest ministries, which are not responsible for development of urban and peri-urban areas. Extreme poverty and hunger are predominantly rural, with smallholder farmers and their families making up a very significant proportion of the poor and hungry.

## Land Degradation

This report is probably based on climate analysis with minimum use of soil resource information.

## Resource development for professional education and training in agroforestry

Extensive farming on steep slopes after famine in the 1990s. To develop and sustain urban forests in developing countries, urban forestry must initially focus on fulfilling immediate requirements for basic products.
